and attenuate plant architecture, plant quality traits, plant reproduction and seed development, endoreduplication in storage cells, storage tissues and/or storage organs of plants or its parts. Cells, useful as an immunogen to generate antibodies. CCP protein is useful to screen for naturally occurring CCP substrates. The polymucleotide is useful for expressing CCP protein, to detect CCP mRNM, or a genetic lesion in a CCP gene and to modulate CCP activity. The present sequence represents a motif which may be found in a CCP protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               AMW30303) of the DEF box, are antagonists of the heterodimeriation of a DP protein with an EZP protein. Also claimed are variants of these peptides, especially containing substitutions of residues corresponding to residues 167, 169, 171 and 175 of DP-1, fusion proteins (III) comprising (I) or (II) and a membrane translocation sequence (see AAW3068), expression vectors encoding (I)-(III) and host cells. (I)-(III) are used therapeutically to induce apoptosis, specifically in tumour or cardiovascular cells, either in vivo or in vitro, e.g. for purging bone marrow. Surgical stents comprising (I)-(III) are used to treat or prevent restenosis in patients who have undergone angioplasty. (I)-(III) function by inactivating the DNA-binding activity of DP/EZF heterodimers. They are also

                                                                                                                                                                                         ઠે
                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       This invention describes a novel insulin-like growth factor binding protein (IBP) constructed using the formula R1-C-X1-PNC-X2-QC-X3-CWCV-X4-C-K2 where cyclic, glycosylated, phosphorylated, acetylated, amidated, culphated derivatives and fragments of these with the physiological ability of IBP are included and RINH2 = an amino acid or peptide with a sequence of up to 41 amino acid residues, X1 = a peptide consisting of 24-31 amino acids, X2 = a peptide consisting of peptide consisting of 10 amino acids, X4 = a peptide consisting of 18-24 amino acids, R2COH = CONH2 or a peptide with up to 12 amino acids. The products of the invention have immunoprotective, antiproliferative, anti-inflammatory and cytostatic activity. The IBP peptides, complexes, antibodies, inhibitors and (antisense) nucleic acids are all useful in the treatment of muscle loss/shrinkag/wastage, osteoporosis, diabetes, inflammatory processes, cancer, inflammatory and neoplastic diseases, inflammatory processes, cancer, inflammatory and neoplastic diseases, inflammatory processes, cancer, inflammatory and neoplastic diseases, inflammatory and wound or bone healing. The nucleic acids and antisense
                                                                                                                                                  .

                                                                                                                                                                                                                                                                                                                                                                             Insulin-like growth factor binding protein; IBP; immunoprotective; antiproliferative; anti-inflammatory; cytostatic; treatment; muscle loss; shrinkage; wastage; osteoporosis; diabetees; amyloid lateral sclerosis; neuropathy; inflammation; cancer; neoplastic disease; growth disturbance; muscle; bone apparatus; wound healing; bone healing; gene therapy; diagnosis; nervous system; lymph gland; stommach; intestinal tract.
                                                                                                                                                    Gaps
used as research reagents, as positive controls in assays for identifying antagonists of DP-1/E2F dimerisation and as immunoassay agents. Also described is the use of sequences antisense to nucleic acids encoding (I)-(III) to control DP levels in cells, particularly by gene therapy. When formulated with cytotoxic or cytostatic agents, (I)-(III) enhance cell killing.
                                                                                                                                                    ;

ö
oligonuclectides can be used in somatic or non-somatic gene therapy. The peptides, etc., can be used in diagnosis of functional deficiencies in bones, muscles, nervous systems, lymph glands, etcmach/intestinal tracts, immune systems, for diabetes, inflammatory and neoplastic processes and also as a marker for cancer. This sequence represents a specific claimed example of a peptide which can occupy the XI position of the IBP of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence is an N-terminal fragment from a protein which has a mol. wt. of 15 kD by SDS-PAGE under reducing conditions, strong affinity to cation exchanger and heparin and osteoblast proliferating activity which is reduced after 10 mins. at 70 degrees C, and is lost after after 10 mins. at 90 degrees C. The protein, which was obtd. from the human foetal fibroblast cell inc IMR-90 (ATCC-CC1186), can be used to treat bone reducing diseases, e.g. osteoporosis, and as an antigen for the immunological diagnosis of such diseases.

Patent No. 626834

GENERAL INFORMATION:
APPLICANT: La Thangue, Nicholas B
APPLICANT: La Thangue, Nicholas B
APPLICANT: Bandara, Lesantha R
TITLE OF INVENTION: Peptide antagonists of DP transcription factors
FITE REPRENENCE: 620-67
CURRENT APPLICATION NUMBER: US/09/308,935
CURRENT PILING DATE: 1999-05-27
FARLIER APPLICATION NUMBER: PCT/GB97/03506
FARLIER APPLICATION NUMBER: PCT/GB97/03506
FARLIER APPLICATION NUMBER: 1997-12-20
FARLIER PILING DATE: 1996-12-20
FORTWARE: PatentIn Ver. 2.1
SEQ ID NO 15

                                                                                     WS-09-308-935-11

WS-09-308-935-11

Sequence 11, Application US/09308935

Patent No. 6268334

GENERAL INFORMATION:

APPLICANT: La Thanque, Nicholas B

APPLICANT: Bandara, Lasantha R

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

CURRENT PAPLICATION NUMBER: US/09/308,935

CURRENT APPLICATION NUMBER: US/09/308,935

CURRENT APPLICATION NUMBER: US/09/103506

EARLIER PILING DATE: 1999-12-22

Mammalian, reproductive-specific protein; male infertility;
spermatogenesis; sperm count disorder; anti infertility; reproduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a protein, which has a mol. wt. of 15 kD by SDS-PAGE under reducing conditions, strong affinity to cation exchanger and heparin and osteoblast proliferating activity which is reduced after 10 mins. at 70 degrees C, and is lost after after 10 mins. at 90 degrees C. The protein, which was obtd. from the human foetal fibroblast cell line IR*90 (ATCC-CLIB6), can be used to treat bone reducing diseases, e.g. osteoporosis, and as an antigen for the immunological diagnosis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Novel 15 kD protein with osteoblast proliferating activity - useful in treatment and diagnosis of bone reducing diseases such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence is an N-terminal fragment from a protein which has a mol. wt. of 15 kD by SDS-PAGE under reducing conditions, strong affinity to cation exchanger and heparin and osteoblast proliferating activity which is reduced after 10 mins. at 70 degrees C, and is lost after after 10 mins. at 90 degrees C. The protein, which was obtd. from the human foetal fibroblast cell line IMR-90 (ATCC-CCL186), can be used to treat bone reducing diseases, e.g. osteoporosis, and as an antigen for the immunological diagnosis of such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              useful

```
The present invention relates to the isolation of novel mammalian and human reproductive-specific proteins (AAU07859-AAU07899), and the nucleic acids encoding them. The nucleic acids encoding infertility required encoding them. The nucleic acids encoding infertility which is a result of reduced sperm count, reduced sperm motility, which is a result of reduced sperm count, reduced sperm motility, which is a result of reduced sperm count, reduced sperm motility, and for capermaces of the invention are useful as markers for spermatcognial cells, for identifying genes or proteins characteristic of male infertility, diagnosing or aiding in proteins of infertility in men, and for contraception in which the diagnosis of infertility in men, and for contraception in which sperm the production or sperm count is reduced or defective sperm is contracted. Antibodies to reproductive-specific proteins are useful for dense in particular cell type or particular developmental stage, for setulates of spermatogenesis, and for immunofluorescence of germ cells or in Western blots for assessing the presence of the protein the antibody binds. The sequences of the invention are also useful in gene therapy. AAU07889 Tepresent the mammalian reproduction-specific proteins of the present invention.
                                                                                                                                                                                                                                                   Novel reproduction-specific protein, useful for treating disorders of reduced sperm count, enhancing/increasing sperm count and/or sperm
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; prostate specific protein; cytostatic; PSP; prostate cancer; gene therapy; vaccine; non-cancerous prostatic disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human prostate specific protein DEX0283_180.

The invention relates to an isolated polypeptide that comprises a sequence with 60 % sequences identity to one of 103 prostate specific corporates properly one of 104 prostate specific concoded by a mucleic acid comprising one of 114 prostate specific nucleic corcoded by a mucleic acid comprising one of 114 prostate specific nucleic acid (PSNA) sequences (S2), given in specification. Also included are a vector comprising the PSNA, a host cell comprising the vector.

The sequences of sequences (S2), given in specification. Also included are a vector comprising the PSNA, a host cell comprising a with vector of the PSP or the PSNA, in a sample of a patient cancer or presence of cancer in a patient, comprising a with for an avaccine comprising the PSP or the PSNA, The PSNA is useful for an avaccine comprising the PSP or the PSNA, The PSNA is useful for determining the presence of a prostate specific nucleic acid (PSNA) in a sample. The antibody to the PSP or the PSNA, The PSNA is also useful for a prostate specific protein in a sample. The antibody is also useful for arbibody induces an immune response against the prostate cancer cell antibody induces an immune response against the prostate cancer cell cut and onlecule or polypeptide. The PSP or the PSNA is useful for expressing the nucleic acid monicoring the presence and metastases of prostate cancer in a patient. The PSP is useful as a vaccine component of a liciting a humoral and entagnist. The PSNA is useful for cellular immune response, and for producing transgenic animals and cells, and for producing engineered producing transgenic animals and cells, and for producing prostate cancer by detecting generic lessues of prostate cancer. By detecting generic lessues of the PSNA are useful for detecting of identifying prostate tissue, and thus is useful in for identifying. Event and the antibody are useful for identifying prostate tissue, and the space of the PSNA are also useful in tenser cancer. The PSNA is useful in for identifying prostate cancer in a patient a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate tissue. The present sequence is a prostate specific protein (PSP) sequence.
                                                                                                                                                                                                         New prostate specific polypeptides useful for identifying, diagnosing, monitoring, staging, imaging and treating prostate cancer and non-cancerous disease states in prostate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Gарв

    The present invention relates to the isolation of novel human colon associated polypeptides, and the cDNA (AAS19348-AAS19581) and genomic sequences encoding for them. The sequences of the invention are useful in the diagnosis. Colon cancer, congenital abnormalities of the colon including colon cancer, congenital abnormalities of the colon including colon cancer, congenital abnormalities of the colon including colon cancer, congenital abnormalities inflammatory bowel disease (IBD), neoplastic cell disorders inflammatory bowel disease (IBD), neoplastic cell disorders, colonic inflammation, diarrhoes and dysentery, malabsorption syndromes colonic inflammation, diarrhoes and dysentery, malabsorption syndromes colonic inflammation, diarrhoes and dysentery, malabsorption syndromes colonic inflammation, represent the invention can also be used in gene the polymucleocides sequences of the invention can also be used in gene therapy. AAU22468-AAU22701 represent the novel human colon associated color properties of the invention. The sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed Note: The sequence data for this patent did not form part of the printed Security from WIPO

```

RESULT 41

The present invention provides the protein and coding sequences of a number of human digestive system antigens. These can be used in the diagnosis, treatment and prevention of digestive system disorders, including cancer, Meckel's diverticulum, bacterial or parasitic

Claim 11; SEQ ID NO 1879; 986pp; English.

                                                                                                                                                                                                                                                                                                            amino acid sequences given in AAM819217 to AAM91921. (I) have cytostatic activity, and can be used in gene therapy and vaccine production. (I) proteins and polynucleotides may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate (I) expression. For example, they may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of (I) by expressing inactive proteins or to supplement the patients own production of (I). Additionally, (I) polynucleotides may be used to produce the secreted (I), by inserting polynucleotides may be used to produce the secreted (I), by inserting colorin. (I) proteins and polynucleotides may be used to produce the cell to express the protein. (I) proteins and polynucleotides may be used to prevent, diagnose and treat immune/haematopoietic-related diseases, especially cancers and cancer metasteses of haematopoietic-derived cells. AAK64703 to AAK87694 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK349421 to AAK87690 and AAM82169 represent human immune/haematopoietic antigen genomic sequences from the present invention. AAK349421 to AAK87690 and AAM82169

This represents a compound that can inhibit E2F activity. The compound alkanoyl, aloyl, hetero-arylcarbonyl, alkoycarbonyl, aryloxycarbonyl, hetero-arylcarbonyl, alkoycarbonyl, aryloxycarbonyl, hetero-aryloxycarbonyl, or H, R2 is OH, or optionally substituted alkoxy or amino, and A is an E2F family dimer forming region or DNA binding region, of at least 12 consecutive amino acids. Compounds of this formula can be used to inhibit E2P activity, and are useful in the treatment and prevention of tumours and arteriosclerosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps

The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample derived from human heart (see ABA1155-ABA41305). The present sequence is a protesin encoded by one such probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays. By measuring gene expression, the probes are useful for predicting, human heart sate useful for predicting, human heart and vascular system e.g. cardiovascular disease, hypertension, cardiac arrhythmias and congenital heart disease. Sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Protein #6903 encoded by probe for measuring heart cell gene expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Single exon nucleic acid probes for analyzing gene expression in human hearts -
measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

Sequence 4, Application US/09900147

Sequence 1, Application US/09900147

Patent No. US20020103121A1

GENERAL INFORMATION:

APPLICANT: La Thangue, Nicholas B

APPLICANT: La Bandara, Lasantha R

TITLE OF INVENTION: Peptide antagonists of DP transcription factors

FITE REPRESENCE: 200-67

CURRENT APPLICATION NUMBER: US/09/900,147

CURRENT APPLICATION NUMBER: BARLIER APPLICATION NUMBER: 09/308,935

PRIOR FILING DATE: EARLIER FILING DATE: 1999-05-27

PRIOR FILING DATE: EARLIER FILING DATE: 1996-12-20

NUMBER OF SEQ ID NOS: 18

SEQ ID NO 4

LENGTH: 20

LENGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                           APPLICANT: La Thangue, Nicholas B

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
